

PS-4 AC DRIVE

Preface

The PS-4 series AC drive is a general-purpose high-performance current vector control AC drive. It can implement the control of asynchronous motor and permanent magnet synchronous motor (PMSM). It increases the user programmable function, background monitoring software and communication bus function, and supports multi-kind PG cards. It is used to drive various automation production equipment involving textile, paper-making, wiredrawing, machine tool, packing, food, fan and pump.

This manual describes the correct use of the PS-4 series AC drive, including selection, parameter setting, commissioning, maintenance & inspection. Read and understand the manual before use and forward the manual to the end user.

Notes

- The drawings in the manual are sometimes shown without covers or protective guards . Remember to install the covers or protective guards as specified first, and then perform operations in accordance with the instructions .
- The drawings in the manual are shown for description only and may not match the product you purchased.
- The instructions are subject to change, without notice, due to product upgrade, specification modification as well as efforts to increase the accuracy and convenience of the manual.
- Contact our agents or customer service center if you have problems during the use.

Chapter 1 Safety Information and Precautions

In this manual, the notices are graded based on the degree of danger:

-  **DANGER** indicates that failure to comply with the notice will result in severe personal injury or even death.
-  **WARNING** indicates that failure to comply with the notice will result in personal injury or property damage.

Read this manual carefully so that you have a thorough understanding. Installation, commissioning or maintenance may be performed in conjunction with this chapter. PS will assume no liability or responsibility for any injury or loss caused by improper operation.

1. 1 Safety Information

Use Stage	Safety Grade	Precautions
Before installation	 DANGER	<ul style="list-style-type: none">• Do not install the equipment if you find water seepage, component missing or damage upon unpacking.• Do not install the equipment if the packing list does not conform to the product you received.
	 WARNING	<ul style="list-style-type: none">• Handle the equipment with care during transportation to prevent damage to the equipment.• Do not use the equipment if any component is damaged or missing. Failure to comply will result in personal injury.• Do not touch the components with your hands. Failure to comply will result in static electricity damage.
During installation	 DANGER	<ul style="list-style-type: none">• Install the equipment on incombustible objects such as metal, and keep it away from combustible materials. Failure to comply may result in a fire.• Do not loosen the fixed screws of the components, especially the screws with red mark .
	 WARNING	<ul style="list-style-type: none">• Do not drop wire end or screw into the AC drive. Failure to comply will result in damage to the AC drive.• Install the AC drive in places free of vibration and direct sunlight.• When two AC drives are laid in the same cabinet, arrange the installation positions properly to ensure the cooling effect.

Use Stage	Safety Grade	Precautions
At wiring	 DANGER	<ul style="list-style-type: none"> Wiring must be performed only by qualified personnel under instructions described in this manual. Failure to comply may result in unexpected accidents . A circuit breaker must be used to isolate the power supply and the AC drive. Failure to comply may result in a fire. Ensure that the power supply is cut off before wiring. Failure to comply may result in electric shock . Tie the AC drive to ground properly by standard. Failure to comply may result in electric shock .
	 WARNING	<ul style="list-style-type: none"> Never connect the power cables to the output terminals (U, V, W) of the AC drive. Pay attention to the marks of the wiring terminals and ensure correct wiring. Failure to comply will result in damage to the AC drive. Never connect the braking resistor between the DC bus terminals (+) and (-) . Failure to comply may result in a fire. Use wire sizes recommended in the manual. Failure to comply may result in accidents . Use a shielded cable for the encoder, and ensure that the shielding layer is reliably grounded.
Before power-on	 DANGER	<ul style="list-style-type: none"> Check that the following requirements are met: <ul style="list-style-type: none"> The voltage class of the power supply is consistent with the rated voltage class of the AC drive. The input terminals (R, S, T) and output terminals (U, V, W) are properly connected. No short-circuit exists in the peripheral circuit. The wiring is secured. Failure to comply will result in damage to the AC drive Do not perform the voltage resistance test on any part of the AC drive because such test has been done in the factory. Failure to comply will result in accidents .
	 WARNING	<ul style="list-style-type: none"> Cover the AC drive properly before power-on to prevent electric shock . All peripheral devices must be connected properly under the instructions described in this manual. Failure to comply will result in accidents
After power-on	 DANGER	<ul style="list-style-type: none"> Do not open the AC drive's cover after power-on. Failure to comply may result in electric shock . Do not touch any I/O terminal of the AC drive. Failure to comply may result in electric shock .
	 WARNING	<ul style="list-style-type: none"> Do not touch the rotating part of the motor during the motor auto-tuning or running. Failure to comply will result in accidents. Do not change the default settings of the AC drive. Failure to comply will result in damage to the AC drive.

Use Stage	Safety Grade	Precautions
During operation	 DANGER	<ul style="list-style-type: none"> Do not touch the fan or the discharging resistor to check the temperature. Failure to comply will result in personal burnt. Signal detection must be performed only by qualified personnel during operation. Failure to comply will result in personal injury or damage to the AC drive.
	 WARNING	<ul style="list-style-type: none"> Avoid objects falling into the AC drive when it is running. Failure to comply will result in damage to the AC drive. Do not start/stop the AC drive by turning the contactor ON/OFF. Failure to comply will result in damage to the AC drive.
During maintenance	 DANGER	<ul style="list-style-type: none"> Repair or maintenance of the AC drive may be performed only by qualified personnel. Failure to comply will result in personal injury or damage to the AC drive. Do not repair or maintain the AC drive at power-on. Failure to comply will result in electric shock. Repair or maintain the AC drive only ten minutes after the AC drive is powered off. This allows for the residual voltage in the capacitor to discharge to a safe value. Failure to comply will result in personal injury. Ensure that the AC drive is disconnected from all power supplies before starting repair or maintenance on the AC drive. Set and check the parameters again after the AC drive is replaced. All the pluggable components must be plugged or removed only after power-off. The rotating motor generally feeds back power to the AC drive. As a result, the AC drive is still charged even if the motor stops, and the power supply is cut off. Thus ensure that the AC drive is disconnected from the motor before starting repair or maintenance on the AC drive.

1.2 General Precautions

1) Requirement on residual current device (RCD)

The AC drive generates high leakage current during running, which flows through the protective earthing (PE) conductor. Thus install a type-B RCD at primary side of the power supply. When selecting the RCD, you should consider the transient and steady-state leakage current to ground that may be generated at startup and during running of the AC drive. You can select a specialized RCD with the function of suppressing high harmonics or a general-purpose RCD with relatively large residual current.

2) High leakage current warning

The AC drive generates high leakage current during running, which flows through the PE conductor. Earth connection must be done before connection of power supply. Earthing shall comply with local regulations and related IEC standards.

3) Motor insulation test

Perform the insulation test when the motor is used for the first time, or when it is reused after being stored for a long time, or in a regular check-up, in order to prevent the poor insulation of motor windings from damaging the AC drive. The motor must be disconnected from the AC drive during the insulation test. A 500-V mega-Ohm meter is recommended for the test. The insulation resistance must not be less than 5 MΩ .

4) Thermal protection of motor

If the rated capacity of the motor selected does not match that of the AC drive, especially when the AC drive's rated power is greater than the motor's, adjust the motor protection parameters on the operation panel of the AC drive or install a thermal relay in the motor circuit for protection.

5) Running at over 50 Hz

The AC drive provides frequency output of 0 to 3200 Hz (Up to 300 Hz is supported if the AC drive runs in CLVC and SFVC mode). If the AC drive is required to run at over 50 Hz, consider the capacity of the machine.

6) Vibration of mechanical device

The AC drive may encounter the mechanical resonance point at some output frequencies, which can be avoided by setting the skip frequency.

7) Motor heat and noise

The output of the AC drive is pulse width modulation (PWM) wave with certain harmonic frequencies, and therefore, the motor temperature, noise, and vibration are slightly greater than those when the AC drive runs at power frequency (50 Hz).

8) Voltage-sensitive device or capacitor on output side of the AC drive

Do not install the capacitor for improving power factor or lightning protection voltage-sensitive resistor on the output side of the AC drive because the output of the AC drive is PWM wave. Otherwise, the AC drive may suffer transient overcurrent or even be damaged.

9) Contactor at the I/O terminal of the AC drive

When a contactor is installed between the input side of the AC drive and the power supply, the AC drive must not be started or stopped by switching the contactor on or off. If the AC drive has to be operated by the contactor, ensure that the time interval between switching is at least one hour since frequent charge and discharge will shorten the service life of the capacitor inside the AC drive.

When a contactor is installed between the output side of the AC drive and the motor, do not turn off the contactor when the AC drive is active. Otherwise, modules inside the AC drive may be damaged.

10) When external voltage is out of rated voltage range

The AC drive must not be used outside the allowable voltage range specified in this manual. Otherwise, the AC drive's components may be damaged. If required, use a corresponding voltage step-up or step-down device.

11) Prohibition of three-phase input changed into two-phase input

Do not change the three-phase input of the AC drive into two-phase input. Otherwise, a fault will result or the AC drive will be damaged.

12) Surge suppressor

The AC drive has a built-in voltage dependent resistor (VDR) for suppressing the surge voltage generated when the inductive loads (electromagnetic contactor, electromagnetic relay, solenoid valve, electromagnetic coil and electromagnetic brake) around the AC drive are switched on or off. If the inductive loads generate a very high surge voltage, use a surge suppressor for the inductive load or also use a diode.

Note

Do not connect the surge suppressor on the output side of the AC.

13) Altitude and de-rating

In places where the altitude is above 1000 m and the cooling effect reduces due to thin air, it is necessary to de-rate the AC drive. Contact PS for technical support.

14) Some special usages

If wiring that is not described in this manual such as common DC bus is applied, contact the agent or PS for technical support.

15) Disposal

The electrolytic capacitors on the main circuits and PCB may explode when they are burnt. Poisonous gas is generated when the plastic parts are burnt. Treat them as ordinary industrial waste.

16) Adaptable Motor

- The standard adaptable motor is adaptable four-pole squirrel-cage asynchronous induction motor or PMSM. For other types of motor, select a proper AC drive according to the rated motor current.
- The cooling fan and rotor shaft of non-variable-frequency motor are coaxial, which results in reduced cooling effect when the rotational speed declines. If variable speed is required, add a more powerful fan or replace it with variable-frequency motor in applications where the motor overheats easily.
- The standard parameters of the adaptable motor have been configured inside the AC drive. It is still necessary to perform motor auto-tuning or modify the default values based on actual conditions. Otherwise, the running result and protection performance will be affected.
- The AC drive may alarm or even be damaged when short-circuit exists on cables or inside the motor. Therefore, perform insulation short-circuit test when the motor and cables are newly installed or during routine maintenance. During the test, make sure that the AC drive is disconnected from the tested parts.

Chapter 2 Product Information

2. 1 Designation Rules and Nameplate of the PS-4

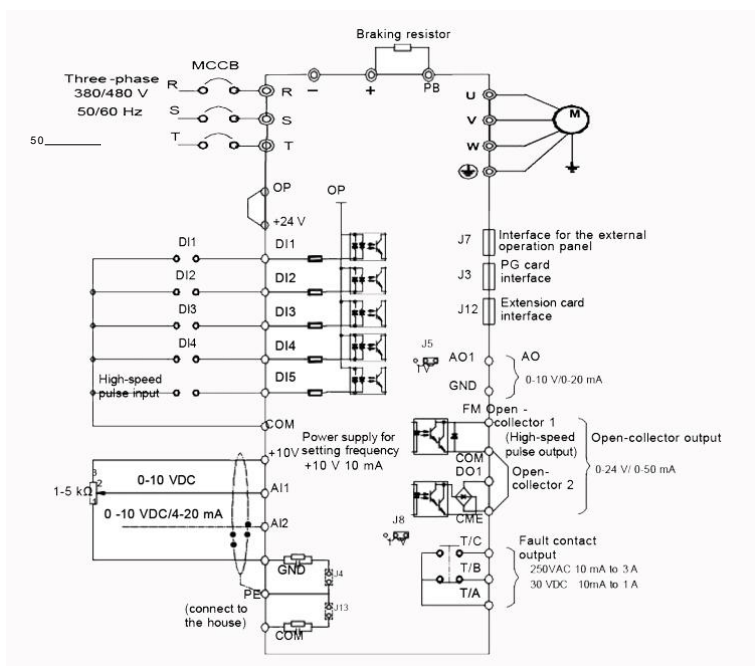

2.2 Description of Control Circuit Terminals

Type	Terminal	Name	Function Description
Power supply	+ 10V-GND	External + 10 V power supply	Provide + 10 V power supply to external unit. Generally, it provides power supply to external potentiometer with resistance range of 1–5 k Ω . Maximum output current: 10 mA
	+24V-COM	External +24 V power supply Applying to Overvoltage Category II circuit	Provide +24 V power supply to external unit. Generally, it provides power supply to DI/DO terminals and external sensors. Maximum output current: 200 mA
	OP	Input terminal of external power supply	Connect to +24 V by default. When DI1-DI5 need to be driven by external signal, OP needs to be connected to external power supply and be disconnected from +24 V.

Type	Terminal	Name	Function Description
Analog input	AI1-GND	Analog input 1	Input voltage range: 0– 10 VDC Impedance: 22 kΩ
	AI2-GND	Analog input 2	Input range: 0– 10 VDC/4–20 mA, decided by jumper J8 on the control board Impedance: 22 kΩ (voltage input), 500 Ω (current input)
Digital input	DI1- OP	Digital input 1	Optical coupling isolation, compatible with dual polarity input Impedance: 2.4 kΩ Voltage range for level input: 9–30 V
	DI2- OP	Digital input 2	
	DI3- OP	Digital input 3	
	DI4- OP	Digital input 4	
	DI5- OP	High-speed pulse input	Besides features of DI1– DI4, it can be used for high-speed pulse input. Maximum input frequency: 100 kHz
Analog output	AO1-GND	Analog output 1	Voltage or current output is decided by jumper J5. Output voltage range: 0– 10 V Output current range: 0–20 mA
Digital output	DO1-CME	Digital output 1	Optical coupling isolation, dual polarity open collector output Output voltage range: 0–24 V Output current range: 0–50 mA Note that CME and COM are internally insulated, but they are shorted by jumper externally. In this case DO1 is driven by +24 V by default. If you want to drive DO1 by external power supply, remove the jumper.
	FM- COM	High-speed pulse output	It is limited by P5-00 (FM terminal output mode selection). As high-speed pulse output, the maximum frequency hits 100 kHz. As open-collector output, its specification is the same as that of DO1
Relay output	T/A-T/B	NC terminal	Contact driving capacity: 250 VAC, 3 A, COSφ = 0.4 30 VDC, 1 A Applying to Overvoltage Category II circuit
	T/A-T/C	NO terminal	

2.3 Wiring of AC Drive Control Circuit

2 . 4 Operation Panel

You can modify the parameters, monitor the working status and start or stop the YW260 by operating the operation panel, as shown in the following figure.

Figure 4-1 Diagram of the operation panel

4. 1.1 Description of Indicators

- RUN

ON indicates that the AC drive is in the running state, and OFF indicates that the AC drive is in the stop state.

- LOC

It indicates whether the AC drive is operated by means of operation panel, terminals or communication.

<input type="radio"/> LOC: OFF	Operation panel control
<input checked="" type="radio"/> LOC: ON	Terminal control
<input type="radio"/> LOC: blinking	Communication control

- F/R

ON indicates reverse rotation, and OFF indicates forward rotation.

- Unit Indicators

● means that the indicator is ON, and ○ means that the indicator is OFF.

Hz— RPM— A % ○ V Hz: unit of frequency

Hz RPM A % ○ V A: unit of current

Hz RPM A % ● V V: unit of voltage

Hz RPM A % ○ V RPM: unit of rotational speed

Hz RPM A % ○ V %: percentage

- Digital Display

The 5-digit LED display is able to display the set frequency, output frequency, monitoring data and fault codes.

○ ● ● ● ●

4. 1.2 Description of Keys on the Operation Panel

Table 4-1 Description of keys on the operation panel

Key	Name	Function
PRG	Programming	Enter or exit Level I menu.
ENTER	Confirm	Enter the menu interfaces level by level, and confirm the parameter setting.
	Increment	Increase data or function code.
	Decrement	Decrease data or function code.
	Shift	Select the displayed parameters in turn in the stop or running state, and select the digit to be modified when modifying parameters.
RUN	RUN	Start the AC drive in the operation panel control mode.

4.5 Definition and Operation of the Multifunction Key (MF.K)

You can define the function (command source switchover or rotation direction switchover) of the multifunction key in P7-01. For details, see the description of P7-01.

4.6 Viewing Status Parameters

In the stop or running state, you can press  on the operation panel to display status parameters. Whether parameters are displayed is determined by the binary bits of values converted from the values of P7-03, P7-04, and P7-05 in the hexadecimal format.

In stop state, a total of 13 status parameters can be displayed, as listed in the following table.

Function Code	Parameter Name	Setting Range	Default																
P7-05	LED display stop parameters	<div>0000– FFFF</div> <div><table><tr><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr></table><div><div>Set frequency (Hz)</div><div>Bus voltage (V)</div><div>DI input status</div><div>DO output status</div><div>AI1 voltage (V)</div><div>AI2 voltage (V)</div><div>AI3 voltage (V)</div><div>Count value</div></div><div><table><tr><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td></tr></table><div><div>Length value</div><div>PLC stage</div><div>Load speed</div><div>PID setting</div><div>Pulse setting</div><div>Frequency</div><div>Reserved</div><div>Reserved</div></div></div></div>	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	33
7	6	5	4	3	2	1	0												
15	14	13	12	11	10	9	8												

In running state, five running status parameters are displayed by default, and you can set whether other parameters are displayed by setting P7-03 and P7-04, as listed in the following table.

Function Code	Parameter Name	Setting Range	Default
P7-03	LED display running parameters 1	7	1F
		6	
		5	
		4	
		3	
		2	
		1	
		0	
P7-04	LED display running parameters 2	15	0
		14	
		13	
		12	
		11	
		10	
		9	
		8	

Chapter 3 Function Code Table

If PP-00 is set to a non-zero number, parameter protection is enabled. You must enter the correct user password to enter the menu.

To cancel the password protection function, enter with password and set PP-00 to 0.

Group F and Group A are standard function parameters. Group U includes the monitoring function parameters.

The symbols in the function code table are described as follows:

"☆": The parameter can be modified when the AC drive is in either stop or running state.

"★": The parameter cannot be modified when the AC drive is in the running state.

"●": The parameter is the actually measured value and cannot be modified.

"*": The parameter is factory parameter and can be set only by the manufacturer.

3. 1Standard Function Parameters

Function Code	Parameter Name	Setting Range	Default	Property
Group P0: Standard Function Parameters				
P0-00	G/P type display	1: G type (constant torque load) 2: P type (variable torque load e.g. fan and pump)	Model dependent	●
P0-01	Motor 1 control mode	0: Sensorless flux vector control (SFVC) 1: Closed-loop vector control (CLVC) 2: Voltage/Frequency (V/F) control	0	★

Chapter 5 Maintenance and Troubleshooting

Before contacting PS for technical support, you can first determine the fault type, analyze the causes, and perform troubleshooting according to the following tables. If the fault cannot be rectified, contact the agent or PS.

Err22 is the AC drive hardware overcurrent or overvoltage signal. In most situations, hardware overvoltage fault causes Err22.

Solutions to the faults of the PS-4

Fault Name	Display	Possible Causes	Solutions
Inverter unit protection	Err01	1: The output circuit is grounded or short circuited. 2: The connecting cable of the motor is too long. 3: The module overheats. 4: The internal connections become loose. 5: The main control board is faulty. 6: The drive board is faulty. 7: The inverter module is faulty.	1: Eliminate external faults . 2: Install a reactor or an output filter. 3: Check the air filter and the cooling fan. 4: Connect all cables properly. 5: Contact the agent or PS.
Overcurrent during acceleration	Err02	1: The output circuit is grounded or short circuited. 2: Motor auto-tuning is not performed. 3: The acceleration time is too short. 4: Manual torque boost or V/F curve is not appropriate. 5: The voltage is too low. 6: The startup operation is performed on the rotating motor. 7: A sudden load is added during acceleration. 8: The AC drive model is of too small power class .	1: Eliminate external faults . 2: Perform the motor auto-tuning. 3: Increase the acceleration time. 4: Adjust the manual torque boost or V/F curve. 5: Adjust the voltage to normal range. 6: Select rotational speed tracking restart or start the motor after it stops. 7: Remove the added load. 8: Select an AC drive of higher power class .
Overcurrent during deceleration	Err03	1: The output circuit is grounded or short circuited. 2: Motor auto-tuning is not performed. 3: The deceleration time is too short. 4: The voltage is too low. 5: A sudden load is added during deceleration. 6: The braking unit and braking resistor are not installed.	1: Eliminate external faults . 2: Perform the motor auto-tuning. 3: Increase the deceleration time. 4: Adjust the voltage to normal range. 5: Remove the added load. 6: Install the braking unit and braking resistor.

Fault Name	Display	Possible Causes	Solutions
Overcurrent at constant speed	Err04	1: The output circuit is grounded or short circuited. 2: Motor auto-tuning is not performed. 3: The voltage is too low. 4: A sudden load is added during operation. 5: The AC drive model is of too small power class.	1: Eliminate external faults. 2: Perform the motor auto-tuning. 3: Adjust the voltage to normal range. 4: Remove the added load. 5: Select an AC drive of higher power class.
Overvoltage during acceleration	Err05	1: The input voltage is too high. 2: An external force drives the motor during acceleration. 3: The acceleration time is too short. 4: The braking unit and braking resistor are not installed.	1: Adjust the voltage to normal range. 2: Cancel the external force or install a braking resistor. 3: Increase the acceleration time. 4: Install the braking unit and braking resistor.
Overvoltage during deceleration	Err06	1: The input voltage is too high. 2: An external force drives the motor during deceleration. 3: The deceleration time is too short. 4: The braking unit and braking resistor are not installed.	1: Adjust the voltage to normal range. 2: Cancel the external force or install the braking resistor. 3: Increase the deceleration time. 4: Install the braking unit and braking resistor.
Overvoltage at constant speed	Err07	1: The input voltage is too high. 2: An external force drives the motor during deceleration.	1: Adjust the voltage to normal range. 2: Cancel the external force or install the braking resistor.
Control power supply fault	Err08	The input voltage is not within the allowable range.	Adjust the input voltage to the allowable range.
Undervoltage	Err09	1: Instantaneous power failure occurs on the input power supply. 2: The AC drive's input voltage is not within the allowable range. 3: The bus voltage is abnormal. 4: The rectifier bridge and buffer resistor are faulty. 5: The drive board is faulty. 6: The main control board is faulty.	1: Reset the fault. 2: Adjust the voltage to normal range. 3: Contact the agent or PS.
AC drive overload	Err10	1: The load is too heavy or locked-rotor occurs on the motor. 2: The AC drive model is of too small power class.	1: Reduce the load and check the motor and mechanical condition. 2: Select an AC drive of higher power class.

Fault Name	Display	Possible Causes	Solutions
Motor overload	Err11	1: P9-01 is set improperly. 2: The load is too heavy or locked-rotor occurs on the motor. 3: The AC drive model is of too small power class .	1: Set P9-01 correctly. 2: Reduce the load and check the motor and the mechanical condition. 3: Select an AC drive of higher power class .
Power input phase loss	Err12	1: The three-phase power input is abnormal. 2: The drive board is faulty. 3: The lightening board is faulty. 4: The main control board is faulty.	1: Eliminate external faults . 2: Contact the agent or SET.
Power output phase loss	Err13	1: The cable connecting the AC drive and the motor is faulty. 2: The AC drive's three-phase outputs are unbalanced when the motor is running. 3: The drive board is faulty. 4: The module is faulty.	1: Eliminate external faults . 2: Check whether the motor three-phase winding is normal. 3: Contact the agent or SET.
Module overheat	Err14	1: The ambient temperature is too high. 2: The air filter is blocked. 3: The fan is damaged. 4: The thermally sensitive resistor of the module is damaged. 5: The inverter module is damaged.	1: Lower the ambient temperature. 2: Clean the air filter. 3: Replace the damaged fan. 4: Replace the damaged thermally sensitive resistor. 5: Replace the inverter module.
External equipment fault	Err15	1: External fault signal is input via DI. 2: External fault signal is input via virtual I/O.	Reset the operation.
Communication fault	Err16	1: The host computer is in abnormal state. 2: The communication cable is faulty. 3: P0-28 is set improperly. 4: The communication parameters in group Pd are set improperly.	1: Check the cabling of host computer. 2: Check the communication cabling. 3: Set P0-28 correctly. 4: Set the communication parameters properly.
Contactor fault	Err17	1: The drive board and power supply are faulty. 2: The contactor is faulty.	1: Replace the faulty drive board or power supply board. 2: Replace the faulty contactor.

Fault Name	Display	Possible Causes	Solutions
Current detection fault	Err18	1: The HALL device is faulty. 2: The drive board is faulty.	1: Replace the faulty HALL device. 2: Replace the faulty drive board.
Motor auto-tuning fault	Err19	1: The motor parameters are not set according to the nameplate. 2: The motor auto-tuning times out.	1: Set the motor parameters according to the nameplate properly. 2: Check the cable connecting the AC drive and the motor.
Encoder fault	Err20	1: The encoder type is incorrect. 2: The cable connection of the encoder is incorrect. 3: The encoder is damaged. 4: The PG card is faulty.	1: Set the encoder type correctly based on the actual situation. 2: Eliminate external faults. 3: Replace the damaged encoder. 4: Replace the faulty PG card.
EEPROM read-write fault	Err21	The EEPROM chip is damaged.	Replace the main control board.
AC drive hardware fault	Err22	1: Overvoltage exists. 2: Overcurrent exists.	1: Handle based on overvoltage. 2: Handle based on overcurrent.
Short circuit to ground	Err23	The motor is short circuited to the ground.	Replace the cable or motor.
Accumulative running time reached	Err26	The accumulative running time reaches the setting value.	Clear the record through the parameter initialization function.
User-defined fault 1	Err27	1: The user-defined fault 1 signal is input via DI. 2: User-defined fault 1 signal is input via virtual I/O.	Reset the operation.
User-defined fault 2	Err28	1: The user-defined fault 2 signal is input via DI. 2: The user-defined fault 2 signal is input via virtual I/O.	Reset the operation.
Accumulative power-on time reached	Err29	The accumulative power-on time reaches the setting value.	Clear the record through the parameter initialization function.
Load becoming 0	Err30	The AC drive running current is lower than P9-64.	Check that the load is disconnected or the setting of P9-64 and P9-65 is correct.
PID feedback lost during running	Err31	The PID feedback is lower than the setting of PA-26.	Check the PID feedback signal or set PA-26 to a proper value.

Fault Name	Display	Possible Causes	Solutions
Pulse-by-pulse current limit fault	Err40	1: The load is too heavy or locked-rotor occurs on the motor. 2: The AC drive model is of too small power class .	1: Reduce the load and check the motor and mechanical condition. 2: Select an AC drive of higher power class .
Motor switchover fault during running	Err41	Change the selection of the motor via terminal during running of the AC drive.	Perform motor switchover after the AC drive stops .
Too large speed deviation	Err42	1: The encoder parameters are set incorrectly. 2: The motor auto-tuning is not performed. 3: P9-69 and P9-70 are set incorrectly.	1: Set the encoder parameters properly. 2: Perform the motor auto-tuning. 3: Set P9-69 and P9-70 correctly based on the actual situation.
Motor over-speed	Err43	1: The encoder parameters are set incorrectly. 2: The motor auto-tuning is not performed.3: P9-69 and P9-70 are set incorrectly.	1: Set the encoder parameters properly. 2: Perform the motor auto-tuning. 3: Set P9-69 and P9-70 correctly based on the actual situation.
Motor overheat	Err45	1: The cabling of the temperature sensor becomes loose. 2: The motor temperature is too high .	1: Check the temperature sensor cabling and eliminate the cabling fault. 2: Lower the carrier frequency or adopt other heat radiation measures.
Initial position fault	Err51	The motor parameters are not set based on the actual situation.	Check that the motor parameters are set correctly and whether the setting of rated current is too small.

Common Faults and Solutions

You may come across the following faults during the use of the AC drive. Refer to the following table for simple fault analysis.

Troubleshooting to common faults of the AC drive

SN	Fault	Possible Causes	Solutions
1	There is no display at power-on.	1: There is no power supply to the AC drive or the power input to the AC drive is too low. 2: The power supply of the switch on the drive board of the AC drive is faulty. 3: The rectifier bridge is damaged. 4: The control board or the operation panel is faulty. 5: The cable connecting the control board and the drive board and the operation panel breaks.	1: Check the power supply. 2: Check the bus voltage. 3: Re-connect the 8-core and 28-core cables. 4: Contact the agent or SET for technical support.
2	"HC" is displayed at power-on.	1: The cable between the drive board and the control board is in poor contact. 2: Related components on the control board are damaged. 3: The motor or the motor cable is short circuited to the ground. 4: The HALL device is faulty. 5: The power input to the AC drive is too low.	1: Re-connect the 8-core and 28-core cables. 2: Contact the agent or SET for technical support.
3	"Err23" is displayed at power-on.	1: The motor or the motor output cable is short-circuited to the ground. 2: The AC drive is damaged.	1: Measure the insulation of the motor and the output cable with a megger. 2: Contact the agent or SET for technical support.
4	The AC drive display is normal upon power-on. But "HC" is displayed after running and stops immediately.	1: The cooling fan is damaged or locked-rotor occurs. 2: The external control terminal cable is short circuited.	1: Replace the damaged fan. 2: Eliminate external fault.
5	Err14 (module overheat) fault is reported frequently.	1: The setting of carrier frequency is too high. 2: The cooling fan is damaged, or the air filter is blocked. 3: Components inside the AC drive are damaged (thermal coupler or others).	1: Reduce the carrier frequency (P0- 15). 2: Replace the fan and clean the air filter. 3: Contact the agent or SET for technical support.

SN	Fault	Possible Causes	Solutions
6	The motor does not rotate after the AC drive runs.	1: Check the motor and the motor cables. 2: The AC drive parameters are set improperly (motor parameters). 3: The cable between the drive board and the control board is in poor contact. 4: The drive board is faulty.	1: Ensure the cable between the AC drive and the motor is normal. 2: Replace the motor or clear mechanical faults. 3: Check and re-set motor parameters.
7	The DI terminals are disabled.	1: The parameters are set incorrectly. 2: The external signal is incorrect. 3: The jumper bar across OP and +24 V becomes loose. 4: The control board is faulty.	1: Check and reset the parameters in group P4. 2: Re-connect the external signal cables. 3: Re-confirm the jumper bar across OP and +24 V. 4: Contact the agent or SET for technical support.
8	The motor speed is always low in CLVC mode.	1: The encoder is faulty. 2: The encoder cable is connected incorrectly or in poor contact. 3: The PG card is faulty. 4: The drive board is faulty.	1: Replace the encoder and ensure the cabling is proper. 2: Replace the PG card. 3: Contact the agent or SET for technical support.
9	The AC drive reports overcurrent and overvoltage frequently.	1: The motor parameters are set improperly. 2: The acceleration/deceleration time is improper. 3: The load fluctuates.	1: Re-set motor parameters or re-perform the motor auto-tuning. 2: Set proper acceleration/deceleration time. 3: Contact the agent or SET for technical support.
10	Err17 is reported upon power-on or running.	The soft startup contactor is not picked up.	1: Check whether the contactor cable is loose. 2: Check whether the contactor is faulty. 3: Check whether 24 V power supply of the contactor is faulty. 4: Contact the agent or SET for technical support.
11	is displayed upon power-on.	Related component on the control board is damaged.	Replace the control board.

Define communication data

This series of frequency converters support four communication protocols: Modbus RTU, CANopen, canlink and PROFIBUS DP, user programmable card and point-to-point communication are derived from canlink protocol. Through these communication protocols, the upper computer can control and monitor the frequency converter and modify and view the functional parameters.

Communication data can be divided into function code data and non function code data. The latter includes operation command, operation status, operation parameters, alarm information, etc.

1 Function code data

The function code data is an important setting parameter of the frequency converter. The functional parameters of group F and group A are as follows:

Function code data	Group P (read/ write)	P0、P1、P2、P3、P4、P5、P6、P7、P8、P9、PA、PB、PC、PD、PE、PF
	Group A (read/ write)	A0、A1、A2、A3、A4、A5、A6、A7、A8、A9、AA、AB、AC、AD、AE、AF

The function code data communication address is defined as follows:

1. When reading function code data for communication

For P0 ~ PF and A0 ~ AF group function code data, the upper sixteen digits of the communication address are directly the function group number, and the lower sixteen digits are directly the serial number of the function code in the function group, for example:

P0-16 function parameters, and its communication address is P010H, where P0H represents P0 group function parameters and 10H represents function code active hexadecimal data format of serial number 16 in the group

AC-08 function parameter, its communication address is AC08, where ACH represents AC group function parameter and 08H represents function code active hexadecimal data in sequence number group 8

2. When writing function code data for communication

For P0 ~ PF group function code data, its communication address is 16 digits high, which is divided into 00 ~ 0F according to whether it is written to EEPROM or P0 ~ PF, the lower 16 digits are the serial number of the function code in the function group, for example:

Parameter writing function P16-P0

When EEPROM does not need to be written, its communication address is 0010H

When EEPROM needs to be written, its communication address is P010H

For A0 ~ AF group function code data, its communication address is 16 digits high.

According to whether it is necessary to write EEPROM, it is divided into 40 ~ 4F or A0 ~ AF,

Define communication data

the lower 16 digits are the serial number of the function code in the function group, for example:

Write function parameter AC-08

When EEPROM does not need to be written, its communication address is 4C08H

When EEPROM needs to be written, its communication address is AC08H

2 Non function code data

Non function code data	Status data (read only)	Monitoring parameters of group U, fault description of frequency converter and operation status of frequency converter.
	Control parameters (write only)	Control command, communication setting value, digital output terminal control, analog output AO1 control, analog output AO2 control, high speed pulse (FMP) output control, parameter initialization.

1. Status data

The status data is divided into u-group monitoring parameters, inverter fault description and inverter operation status

Group u parameter monitoring parameters

For the description of group u monitoring data, see relevant descriptions in Chapter 5 and Chapter 6, and its address is defined as follows:

For U0 ~ UF, the upper sixteen digits of its communication address are 70 ~ 7F, and the lower sixteen digits are the serial number of the monitoring parameters in the group, for example:

U0-11, its communication address is 700bh

Fault description of frequency converter

When the communication reads the fault description of the frequency converter, the communication address is fixed at 8000h, and the upper computer can obtain the current frequency converter fault code by reading the address data. See the definition of f9-14 function code in Chapter V for the description of the fault code

Operation status of frequency converter

When the communication reads the operation status of the frequency converter, the

Define communication data

communication address is fixed at 3000h. The upper computer can obtain the current operation status information of the frequency converter by reading the address data, which is defined as follows:

Operation status and communication address of frequency converter	Read status number definition
3000H	1: Forward running
	2: Reverse operation
	3: Shut down

2. Control parameters

The control parameters are divided into control command, digital output terminal control, analog output AO1 control, analog output AO2 control and high speed pulse (FMP) output control

control command

When P0-02 (command source) is selected as 2: communication control, the upper computer can control the start and stop of the frequency converter and other related commands through the communication address. The control commands are defined as follows:

Control command communication address	Command function
2000H	1: Forward running
	2: Reverse operation
	3: Forward inching
	4: Reverse jog
	5: Free shutdown
	6: Deceleration shutdown
	7: Fault reset

Communication settings

Set value of torque source, PID feedback source, upper limit of intermediate frequency source

The source, etc. is selected as the given data at the given time of communication. The communication address is 1000h. When the upper computer sets the communication address value, the data range is - 10000 ~ 10000, corresponding to the relative given value

Define communication data

of - 100.00% ~ 100.00%

Digital output terminal control

When the function of the digital output terminal is 20: communication control, the upper computer can control the digital output terminal of the frequency converter through the communication address, which is defined as follows:

Digital output terminal control communication address	Command content
2001H	Bit0 : DO1 output control Bit1 : DO2 output control Bit2 : RELAY1 output control Bit3 : RELAY2 output control Bit4 : FMR output control BIT5: VDO1 BIT6: VDO2 BIT7: VDO3 BIT8: VDO4 BIT9: VDO5

Analog output AO1 and AO2, high-speed pulse output FMP control

When the analog output AO1 and AO2, high-speed pulse output and FMP output function are selected as 12: communication setting, the upper computer can control the analog output and high-speed pulse output of the frequency converter through the communication address, which is defined as follows:

Output control communication address		Command content
AO1	2002H	0~7FFF Means 0%~100%
AO2	2003H	
FMP	2004H	

Parameter initialization

This function is required when it is necessary to initialize the parameters of the frequency converter through the upper computer.

If PP-00 (user password) is not 0, first verify the password through communication. After the verification is passed, the upper computer will initialize the parameters within 30 seconds.

The communication address for user password verification is 1F00H. Write the correct user password directly to this address to complete password verification

The address for parameter initialization of communication is 1F01H, and its data content is defined as follows:

Define communication data

Parameter initialization communication address	Command function
1F01H	1: Restore factory parameters
	2: Clearly record information
	4: Restore user backup parameters
	501: back up current user parameters

3. Some mailing addresses

Parameter address	Parameter description	Parameter address	Parameter description
1000H	communication setting (decimal) -10000~10000	1010H	PID setting
1001H	operating frequency	1011H	PID feedback
1002H	bus voltage	1012H	PLC steps
1003H	output voltage	1013H	Pulse input pulse frequency, unit: 0.01 kHz
1004H	output current	1014H	feedback speed, unit: 0.1 Hz
1005H	output power	1015H	remaining operation time
1006H	output torque	1016H	AI1 voltage before correction
1007H	operating speed	1017H	AI2 voltage before correction
1008H	DI input flag	1018H	AI3 voltage before correction
1009H	DO output flag	1019H	linear speed
100AH	AI1 voltage	101AH	current power on time
100BH	AI2 voltage	101BH	current running time

Define communication data

Parameter address	Parameter description	Parameter address	Parameter description
100CH	AI3 voltage	101CH	pulse input pulse frequency, unit: 1Hz
100DH	count value input	101DH	communication set value
100EH	length value input	101EH	actual feedback speed
100FH	load speed	101FH	main frequency X display
		1020H	secondary frequency Y display
